*Clean Sustainable Energy for the 21st Century*

# High Temperature Gas-Cooled Reactors—Now More Than Ever!

Dr. Finis SOUTHWORTH  
Chief Technology Officer  
AREVA Inc.

On behalf of the NGNP Industrial Alliance, LLC

Washington DC Section ANS  
Rockville, MD  
April 12, 2011

**Industry Alliance**

*Clean Sustainable Energy for the 21st Century*

# Roadmap

- ▶ **What is NGNP ?**
- ▶ **What is the NGNP Alliance? – 2006-present**
- ▶ **EPACT 2005 and NGNP activities to date**
- ▶ **HTR / NGNP design description**
- ▶ **Economics of HTRs**
- ▶ **Safety characteristics**
- ▶ **A little more about Fukushima Daiichi topics**
- ▶ **Q&A**

# Next Generation Nuclear Plant History

- ▶ **Next Generation – Generation IV**
- ▶ **Generation IV Roadmap – December 2000 to September 2002**
- ▶ **VHTR Selected as lead concept for US Demonstration-**
  - ◆ New missions of hydrogen production and process heat applications
  - ◆ Most passively safe of all candidate Generation IV reactor concepts
- ▶ **NGNP drafted into Energy Policy Act January 2003**
- ▶ **EPACT required 31 months to pass-- August 8, 2005, authorizing “\$1.5 Billion through 2014, and such sums as may be needed subsequently for construction”**
- ▶ **EPACT 2005 called for DOE to partner with an Industry Alliance to partner for the demonstration and deployment of the NGNP.**
- ▶ **The NGNP Industrial Alliance was first formed in May 2006.**

**Industry Alliance**

*Clean Sustainable Energy for the 21st Century*

# NGNP Industrial Alliance, LLC

**PTAC**  
**SGL**

## Industry Alliance

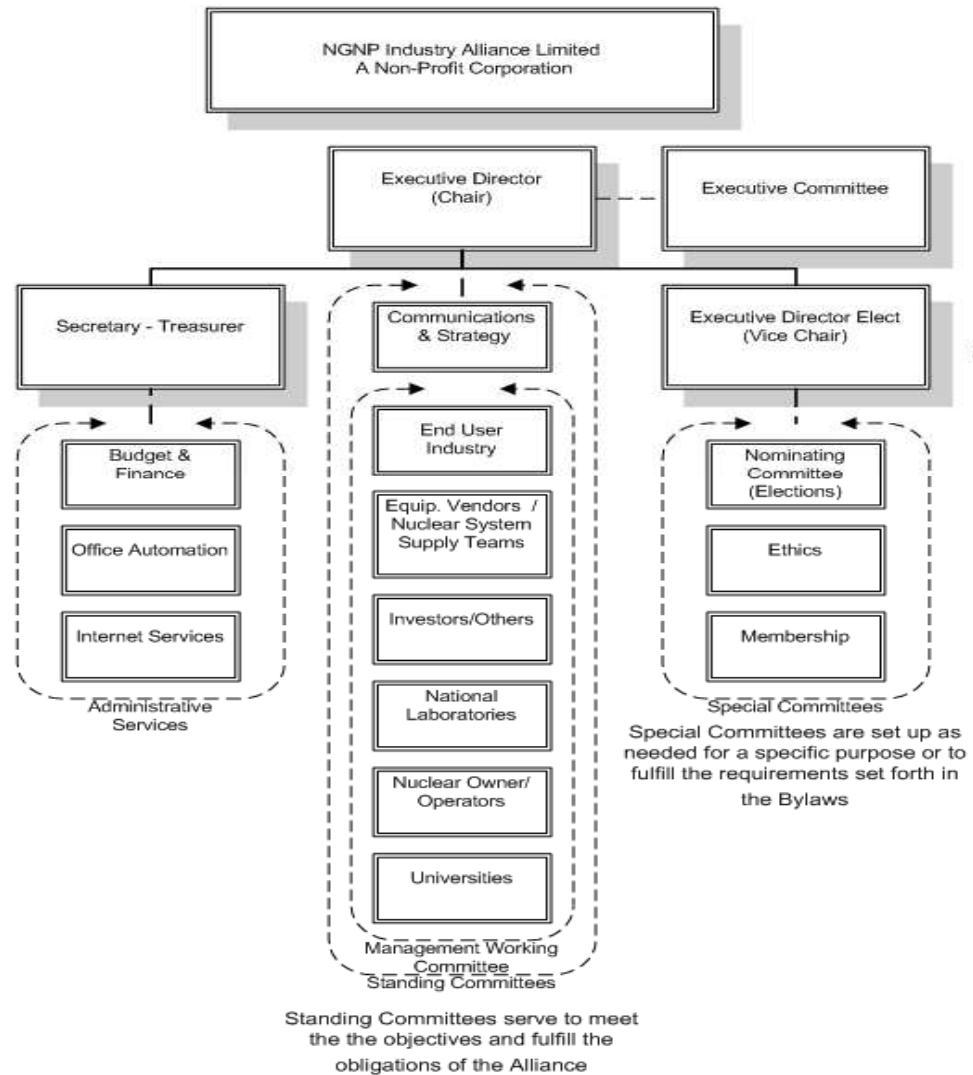

*Clean Sustainable Energy for the 21st Century*

- Mission -  
"To work with Government to  
commercialize High Temperature  
Gas-cooled Reactor technology  
expanding the use of clean  
nuclear energy and significantly reducing  
the dependence on  
premium fossil fuels."

Communications & Strategy Committee  
Recommend the following:  
Keith Belton / Peter Molinaro - Dow Chemical  
Allison Graves / George O'Connor - Entergy  
Mark Haynes - Concordia Power

Management Working Committee:  
Finis Southworth - AREVA  
Fred Moore - Dow Chemical  
Don Halter - ConocoPhillips  
TBD - Eastman Chemical  
John Mahoney - Entergy  
Phil Hildebrandt - BEA INL  
Layla Sandell - Westinghouse  
James Hobbs - B&W

*Clean Sustainable Energy for the 21st Century*

# HTR Design

Industry Alliance

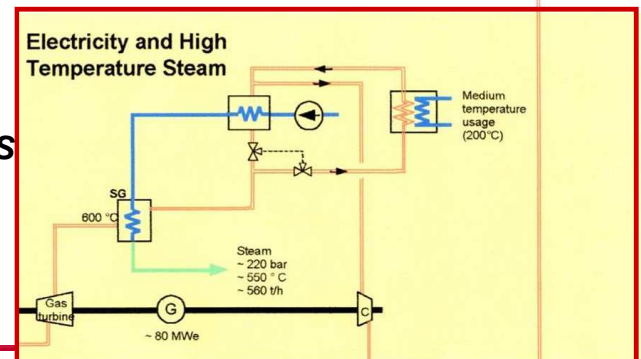

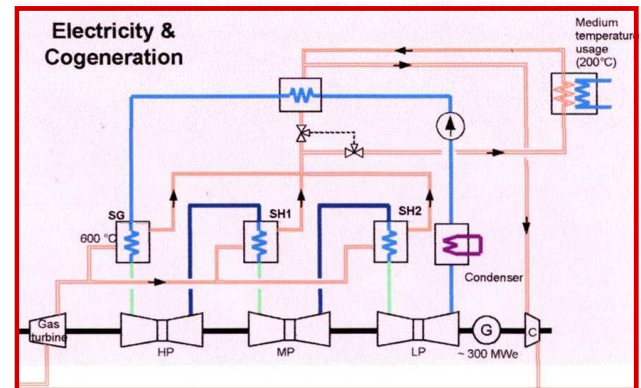

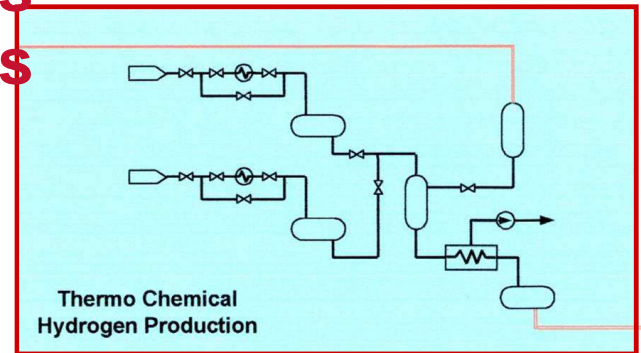

Clean Sustainable Energy for the 21st Century

# Long Term High Temp Gas Reactors For a Spectrum Of Applications

**ANTARES**

- ▶ **SIMPLE**
- ▶ **LOW COST**
- ▶ **COMBINED BRAYTON AND RANKINE CYCLES FOR HIGH EFFICIENCY**
- ▶ **PASSIVELY SAFE**
- ▶ **SUPPORTS H<sub>2</sub> PRODUCTION**

# Key Features of AREVA Near-Term HTR

- ▶ **Prismatic block annular core**
- ▶ **Conventional steam cycle**
- ▶ **Modular reactors**
- ▶ **Inherent safety characteristics**
  - ◆ **Passive decay heat removal**
  - ◆ **Large thermal inertia**
  - ◆ **Negative reactivity feedback**
- ▶ **Minimal reliance on active safety systems**
- ▶ **Sized to minimize steam production cost**
- ▶ **Fully embedded reactor building**
  - ◆ **Partially embedded alternative possible**

# Nominal Operating Parameters

<b>Fuel type</b>	<b>TRISO particle</b>
<b>Core geometry</b>	<b>102 column annular 10 block high</b>
<b>Reactor power</b>	<b>625 MWt</b>
<b>Reactor outlet temperature</b>	<b>750°C</b>
<b>Reactor inlet temperature</b>	<b>325°C</b>
<b>Primary coolant pressure</b>	<b>6 MPa</b>
<b>Vessel Material</b>	<b>SA 508/533</b>
<b>Number of loops</b>	<b>2</b>
<b>Steam generator power</b>	<b>315 MWt (each)</b>
<b>Main circulator power</b>	<b>4 MWe (each)</b>
<b>Main steam temperature</b>	<b>566°C</b>
<b>Main steam pressure</b>	<b>16.7 MPa</b>

**Industry Alliance**

*Clean Sustainable Energy for the 21st Century*

# Annular Core Arrangement

# Cooling Systems Optimized for Reliability, Safety

## ► Main heat transport system

- ◆ Established helical coil steam generator technology
- ◆ Electric motor circulator with magnetic bearings

## ► Shutdown cooling system

- ◆ Active system
- ◆ Maximizes plant availability
  - Maintenance
  - Rapid accident recovery

## ► Reactor cavity cooling system

- ◆ Safety related heat removal system
- ◆ Passive cooling of vessel and surrounding cavity (operates continuously – safety-related)
- ◆ Active cooling of water storage tank during normal operation (non-safety)

**Industry Alliance**

*Clean Sustainable Energy for the 21st Century*

# The Dow Perspective

## About Dow

- ▶ **Diversified chemical company, harnessing the power of science and technology to improve living daily**
- ▶ **Founded in Midland, Michigan, in 1897**
- ▶ **Supplies more than 5,000 products to customers in 160 countries**
- ▶ **Annual sales of \$45 billion**
- ▶ **52,000 employees worldwide**
- ▶ **Committed to Sustainability**

## Industry Alliance

Clean Sustainable Energy for the 21st Century

### Dow Energy Uses

**900,000 BBL  
Oil Eqv / Day  
Or 0.3%  
of the  
World's  
Energy**

**Oil &  
Gas**

**Feedstock**  
Ethane, Propane  
Butane, Naphtha

**Steam**

**600 trillion Btu/yr**

**Power**

## Dow Energy Plan

**Four fundamentals make the transition  
to a sustainable energy future possible.**

- ▶ **Aggressively pursue energy efficiency and conservation**
- ▶ **Increase, diversify and optimize hydrocarbon energy and feedstock supplies**
- ▶ **Accelerate development of alternative and renewable energy and feedstock sources**
  - ◆ **Finally, Dow supports the federal government's efforts to provide financial support to enable leadership in advancing development of new nuclear power technologies. One promising example is the High Temperature Gas Reactor (HTGR), which has the potential to produce synthetic fuels and feedstocks when combined with gasification of coal or other domestic carbon sources.**
- ▶ **Transition to a low carbon economy**

# Power, Heat & Steam Generation

- ▶ **4 GWs of self generated electricity**
- ▶ **More than 22 million pounds per hour of self generated steam**
- ▶ **Enormous direct fired process heating loads**

## Why HTGR?

- ▶ **Inherent safety – co location**
- ▶ **N-X reliable process heat & electricity**
- ▶ **Neutral cost without cost of carbon**
- ▶ **Addresses all key energy policy issues**
  - ◆ **Energy security**
  - ◆ **Carbon footprint**
  - ◆ **National security**
  - ◆ **Jobs**

**Industry Alliance**

*Clean Sustainable Energy for the 21st Century*

# INL Economics Analysis of NGNP

# HTGR Layout For SAGD Integration Modeling

Industry Alliance

Clean Sustainable Energy for the 21st Century

## In US coal for electricity and oil for transportation produce about 3/4 of the man-made CO<sub>2</sub>

U.S. 2002 Carbon Dioxide Emissions from Energy Consumption — 5,682\* Million Metric Tons of CO<sub>2</sub>\*\*

Source: Energy Information Administration, *Emissions of Greenhouse Gases in the United States 2002*, Tables 4-10.  
\*Includes adjustments of 42.9 million metric tons of carbon dioxide from U.S. territories, less 90.2 MTCO<sub>2</sub> from international and military bunker fuels.  
\*\*Previous versions of this chart showed emissions in metric tons of carbon, not of CO<sub>2</sub>.  
\*\*\*Municipal solid waste and geothermal energy.  
Note: Numbers may not equal sum of components because of independent rounding.

Lawrence Livermore National Laboratory, May 2004  
<http://eed.llnl.gov/flow/>

Substitution of electricity from nuclear for coal and hydrogen from nuclear for oil would reduce CO<sub>2</sub> release by 2/3

Process heat from nuclear could eventually replace the remaining 1/3

# INL Plant Capital Cost Development

# Full HTGR Integration for Bitumen Recovery

- ▶ **Assuming a central HTGR facility supplying 2,400 MWt of steam:**
  - ◆ Bitumen recovery of 224,000 barrels per day
  - ◆ Reduction in natural gas consumption – 81.8 billion SCF/year
  - ◆ Reduction in CO<sub>2</sub> emissions – 5.3 million tons/year
  - ◆ Over 60 years this rate of steam supply from the HTGR plant would result in:
    - Supplying 52 simultaneous well pads for 12 years each
    - Supplying 260 well pads over the life of the reactors
    - Covering 65,200 hectares of land
    - Reducing natural gas consumption by 4.9 trillion SCF
    - Reducing CO<sub>2</sub> emissions by 317 million tons
- ▶ **Estimate the potential for 15 plants (60 – 600 MWt modules)**

# Characteristics of Potential Markets, cont'd

## ► Products & Markets, cont'd

### ◆ Process Heat, Hydrogen & Oxygen

- Petro-chemical, Fertilizer, Refining (in addition to co-generation, e.g., cracking operations, direct ammonia production, hydrogenation)
- Merchant Hydrogen – 5.4MMtons (2005), separate from refining industry production and usage of hydrogen
- CTL/BTL (24 new 100,000 bpd plants)
  - Synthetic feedstock, transportation fuels (assumed that production would equal 25% of crude oil imports in 2008)

### ◆ Electricity

- Substitute for Coal & Natural Gas Plants
  - Emissions reductions & saving natural gas resource

# Size of the potential market

► **Petrochemical, Refining, Fertilizer/Ammonia market and other**

◆ **Co-generation**

- 75 GWt (125 – 600 MWt modules)

► **Oil Sands**

◆ **Steam, Electricity & Hydrogen**

- 36 GWt (60 -- 600 MWt modules)

► **Hydrogen Merchant Market**

- 40 GWt (67 – 600 MWt modules)

► **Synthetic Fuels & Feedstock**

◆ **Steam, electricity, hydrogen**

- 249 GWt (415 – 600 MWt modules)

► **Electricity**

- ◆ 110 GWt; ~180 – 600 MWt modules
- ◆ 10% of the nuclear electrical supply increase required to achieve pending Government objectives for emissions reductions by 2050

## The Opportunity — Integrating Nuclear High Temperature Process Heat with Industrial Applications

*Existing Plants – Assuming 25% Penetration of Potential Process Heat & Power Market -- 2.7 quads\**

Fertilizers/Ammonia  
plants in U.S.—NH<sub>3</sub> production)

Petrochemical  
(170 plants in U.S.)

Petroleum Refining  
(137 plants in U.S.)

*Existing and New Markets – Potential for 9.3 quads of HTGR Process Heat & Power*

Hydrogen Production  
60 plants

Coal-to-Liquids (24 – 100,000 bpd new plants )

Oil Sands/Shale  
43 - 56,000 bpd  
plants

\* Quad =  $1 \times 10^{15}$  Btu ( $293 \times 10^6$  MW<sub>th</sub>) annual energy consumption

# Economics Supplying Steam & Electricity

## Equivalent Natural Gas Prices

(Maximum # of Modules)

200 MWt / 1600 MWt -- \$10.8/MMBtu

350 MWt / 1400 MWt -- \$8.3/MMBtu

600 MWt / 2400 MWt -- \$6.8/MMBtu

**Industry Alliance**

*Clean Sustainable Energy for the 21st Century*

# HTR Safety – A quick review

# Safety Functions in NPPs

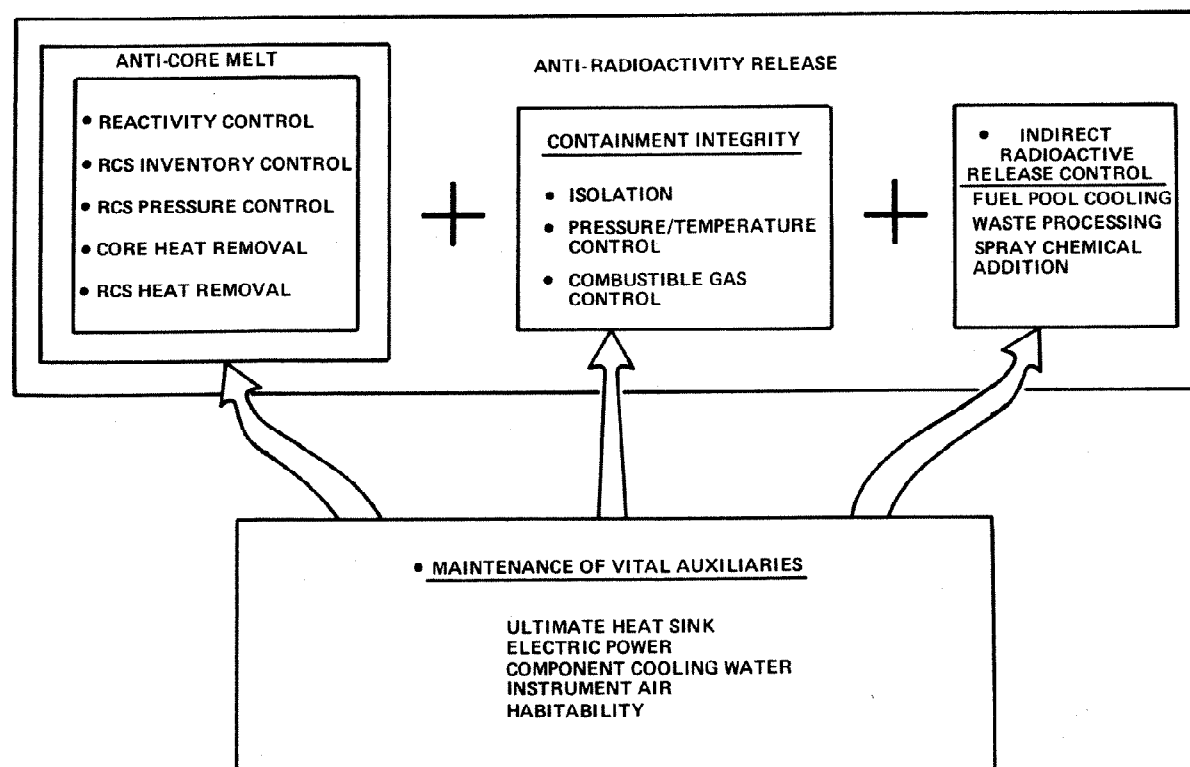

Fig. 1. Classes of safety functions.

# Safety Functions in HTGRs

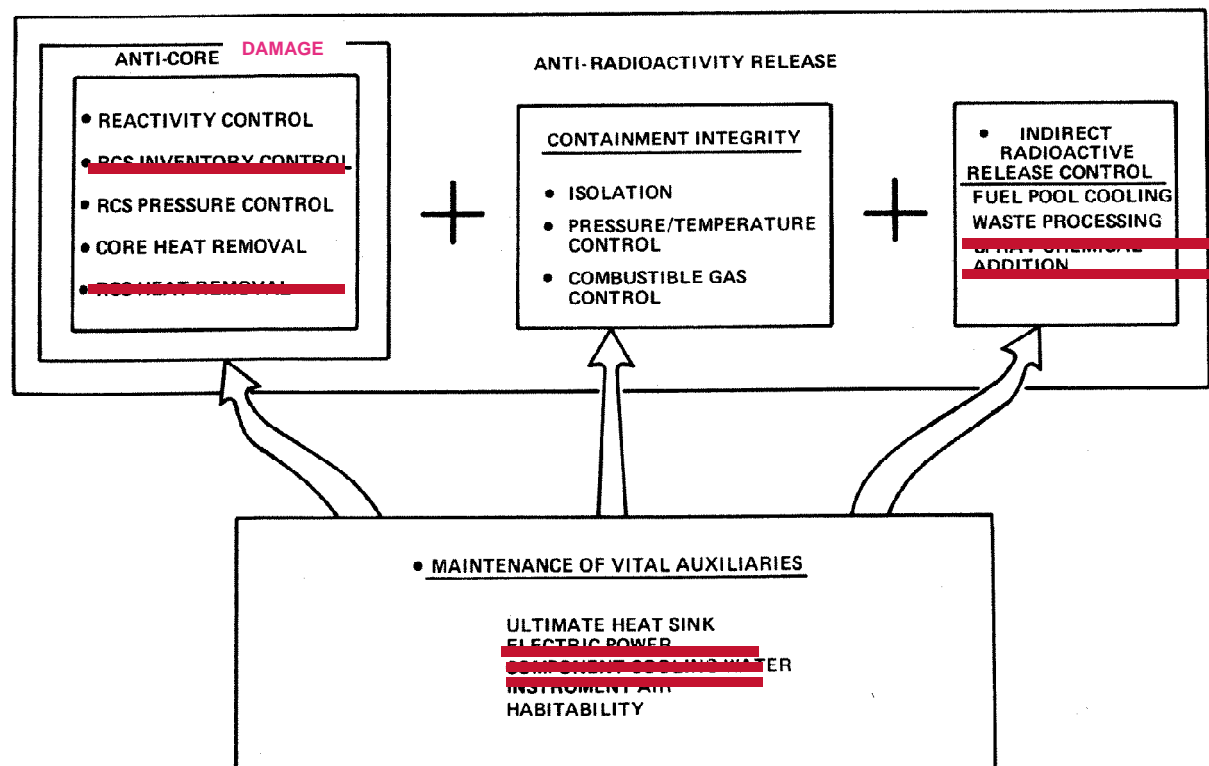

Fig. 1. Classes of safety functions.

## **Safety Functionality for NPPs**

- **Anticipated Operational Occurrences accommodated with high reliability**
- **Design Basis Events – Natural Phenomena (hurricanes, tornadoes, earthquakes, floods, et cetera) as well as postulated faults accidents (LOCA, MSLB, etc.) Meet PAGs at EAB. NGNP is intended to be designed to meet PAGs at 400 meters.**
- **Beyond Design Basis Events – Severe Accidents – not important how you got here, its how you manage it and isolate it. (e.g. FD1 earthquake, tsunami-both worse than design basis) FD1 survived the beyond design basis earthquake well, it appeared. It is the BDBE tsunami that stopped the safety related equipment.**

# **Safety Functionality for LWR v. HTGR**

## **LWR BDBE management**

- **must have A/C to manage the accident**
- **decay heat removal must start within about 30-40 minutes to prevent core damage**
- **maintain primary containment integrity-in severe accident vent to atmosphere or secondary containment – use hydrogen igniter or recombiner**
- **maintain spent fuel pool cooling -- could be done by a hose from a non-electric source –fire water tower, fire truck, etc. –just need to make up for boiling**

## **HTGR BDBE management**

- **decay heat removal must start in about 100 hours**
- **heat would transfer to earth by conduction, radiation and convection (passive) for the reactor vessel.**

## Applicable Frequency Ranges of Regulatory Criteria

## Why HTGR?

- ▶ **Inherent safety – co location**
- ▶ **N-X reliable process heat & electricity**
- ▶ **Neutral cost without cost of carbon**
- ▶ **Addresses all key energy policy issues**
  - ◆ **Energy security**
  - ◆ **Carbon footprint**
  - ◆ **National security**
  - ◆ **Jobs**

## **Fukushima Impact on New Builds**

**As a result of the Fukushima crisis, China has announced a hold on approvals for new projects, but this is not expected to affect projects already approved or under way.**

- ▶ Four AP1000s are under construction in China—two at Haiyang and two more at Sanmen. The first of these are to begin operation by mid-2013.**
- ▶ Eighteen CPR-1000s, developed from a French 900-megawatt pressurized water reactor, are also being built, as well as**
- ▶ Two AREVA EPRs, and**
- ▶ Three indigenously designed CNP-600 units.**
- ▶ Two HTR-PM?**

## **Fukushima Near-term Actions**

**As a result of the Fukushima crisis, Near Term NRC Reviews**

- ▶ **verifying each plant's capability to manage major challenges, such as aircraft impacts and losses of large areas of the plant due to natural events, fires or explosions**
- ▶ **verifying each plant's capability to manage a total loss of off-site power**
- ▶ **verifying the capability to mitigate flooding and the impact of floods on systems inside and outside the plant**
- ▶ **performing walk-downs and inspection of important equipment needed to respond successfully to extreme events like fires and flood.**
